## Temperature Control:

**Heating**--When the ambient temperature is so low that the normal rise of condensed-mercury temperature above the ambient temperature will not bring the condensed-mercury temperature up to the minimum value of the operating ranges specified under **Maximum Ratings**, some form of heat-conserving enclosure or auxiliary heater will be required.

**Cooling**--When the operating conditions are such that the maximum value of the operating condensed-mercury temperature is exceeded, provision should be made for forced-air cooling sufficient to prevent exceeding the maximum value.

Temperature Rise of Condensed Mercury to Equilibrium  
Above Ambient Temperature (Approx.):\*

No load. . . . . 17.5  $^{\circ}$ C

<sup>o</sup> Without external shield.

\* With filament volts = 2.38 and no heat-conserving enclosure.
